PRODUCT DESCRIPTION

**Carapace® EMP110** has been used in the high volume production of PCBs since 1987.

**Carapace® EMP110 HD** is the latest development of the range, formulated to exceed the increasing demands of PCB processes, combined with a large process window.

- Fine solder dam resolution (50μm, 2 mil).

- Fast processing times allowing high throughput and productivity.
- Optimised rheological and coating properties for each method of application.
- Low ionic contamination.
- Solderball elimination.
- High moisture and insulation resistance
- High resistance to low solids fluxes.
- Excellent adhesion to flexible substrates.
- Low odour.
- TGIC-Free version suitable for all final finish requirements
- Halogen-free
- Reach and RoHS compliant

**Carapace® EMP110** is a contact exposure, aqueous developing, liquid photoimageable soldermask, using two-component epoxy technology to give high levels of chemical resistance over copper, copper oxide or gold plated circuits.

Due to their resolution capability, high dielectric strength and physical resistance properties **Carapace® EMP110** soldermasks are used as solder resists and insulation coverings on all types of printed circuits, particularly high-reliability, double-sided and multilayer, fine line, surface mount boards.

CARAPACE®EMP110 PRODUCT RANGE

PASTES:
All Carapace® pastes are coded as EMP110 followed by numbers and letters. The number and letters denote the colour, finish and application method.

Carapace® EMP110 HD is available as standard in the following:

Screen-print:
EMP110/5158 HD TG (Transparent Gloss)
EMP110/5410 HD TM (Transparent Matt)

Air-spray:
EMP110/5393EM TG HD AS (Transparent Gloss)
EMP110/5396EM TM HD AS (Transparent Matt)

HARDENERS:
1) EMP110 PtB - The following hardener is grouped into the EMP110 PtB class:
EMP110 Pt B (H-4090) Transparent
EMP110 Pt B (H-4090 – G) Green
EMP110 Pt B (H-4090 – DG) Dark Green
EMP110 Pt B (H-4090 – LG) Light Green
EMP110 Pt B (H-4090 – N) Black
EMP110 Pt B (H-4090 – B) Blue
EMP110 Pt B (H-4090 – R) Red
Board surface preparation:

Mechanical pre-cleaning:

Brush

320 to 400 grit silicon carbide brushes with a recommended footprint on the copper of 10-15mm. (0.4-0.6 inches).

Brushes should be regularly checked and dressed to ensure optimum preclean is retained.

Pumice Slurry Scrub

Pumice concentration between 18 - 22% (v/v) is recommended (3F or 4F virgin grade).

Slurry should be changed between 500-1000 panels

Aluminium Oxide Slurry Scrub

Aluminium oxide concentration between 18 - 22% (v/v) is recommended (400 grit).

Slurry should be changed between at least 20,000-30,000 panels

Aluminium Oxide Jet Slurry Spray is known to give lower surface roughness compared to other pre-clean methods. Where no other alternative method is available then the following conditions are suggested:

Aluminium oxide concentration between 18 - 22% (v/v) is recommended (220 grit virgin grade).

Jet spray pressure 20-24 PSI ensuring the jet nozzle patterns fully overlap

Slurry should be changed between at least 10,000-20,000 panels

Panels must be fully rinsed such that any slurry particles are completely removed. Failure to remove particles can result in poor cosmetics and adhesion loss.

If panels are heavily oxidised and tarnished then a micro-etch prior to mechanical pre-cleaning is strongly recommended. Panels must be thoroughly rinsed prior to mechanical cleaning stage.

Recommended Surface roughness figures are Ra 0.2-0.4μm.

Chemical pre-cleaning:

High Roughness, Deep-Etching Clean

Due to the excellent mechanical bond achieved between the copper surface and soldermask, proprietary deep-etch chemistries are the preferred method of pre-clean.

For a list of recommended and approved chemistries, please contact your Electra representative.

Microetch Clean

Simple microtech solutions such as sodium persulphate are not recommended as the sole method of preclean.

In all cases panels must be thoroughly rinsed and dried such that no tarnish is present and no water moisture remains in the holes or between closely spaced tracks.

It is recommended that all freshly cleaned panels are coated within 2-4 hours. The actual maximum time will vary depending upon ambient temperature and humidity. Panels left longer than 4 hours should be re-cleaned prior to coating.

www.electrapolymers.com
Mixing:

Carapace® EMP110 HD is supplied in pre-weighed packages of paste + hardener.

The original supplied mix ratio must be used if mixing smaller amounts than the standard pack-size.

Stir well to ensure complete mixing.

Incomplete mixing can cause poor developing, stickiness during exposure and impaired final properties.

Viscosity reduction:

SP formulations:

SP versions of EMP110 are supplied screen ready. If viscosity adjustment is required prior to, or during printing, then this may be achieved using Electrareducer ER1. No more than 5% reducer should be added or deterioration of the printing and drying properties may occur, resulting in thin deposits on track edges and/or prolonged drying times.

AS formulations:

It is advisable to use a slow speed mechanical mixer when mixing in solvent. Care should be taken to avoid incorporating air into the resist during mixing. Resist should be allowed to stand for 2 hours after mixing to allow air to escape. Excessive air in resist can cause microbubbles/voids in the finished film and/or poor curtain stability when curtain-coating.

EMP110 HD AS soldermasks using EMP110 Pt B H-4090 should be reduced with Electrareducer ER6.

Where ER6 is not available, an equivalent from an approved source may be used. The use of non-approved solvents is not recommended as they can cause contamination and other processing problems.

Addition level required will depend on spray system used.

Please contact Electra Technical Support Department for recommendation addition levels.

Due to the fast viscosity readings using a Zahn3 cup, air inclusion can give erratic readings. It is therefore recommended to use the Ford Nº4 or a cup giving similar values (e.g. Frikmar Nº4).

Process settings:

Flat-bed screen printing:

Mesh count: 36 - 54T/cm (92 – 137 mesh) polyester.
Squeegee: 60-70 Shore.

20μm dry thickness should be aimed for; this is typically achieved using a 43T/cm (110 mesh)

The board outline image may be made on the screen using conventional stencil material or masking tape and screen filler. To prevent a build up of ink on the reverse of the screen that may block holes, it is advisable to shift alternate boards along the x- or y-axis before printing. Alternatively, a rudimentary stencil, such as an expanded drill mask, can be used on the screen to prevent ink going into the holes.

Do not utilised the vacuum bed, as this will suck an exaggerated amount of ink into the holes.
Double-side screen printing (Circuit Automation DP machines):

Mesh count: 32-38T/cm (83 – 98 mesh) polyester.
Squeegee: 60-70 Shore.

Typically a flood-print-print cycle is recommended.

Wherever possible the ISO-print feature is recommended to reduce ink deposit into larger holes.

Vacuum chamber de-gassing prior to tack-drying is proven to reduce bubbling between tracks and reduce via-hole “popping” due to solvent entrapment.

Air Spray:

Exact spray parameters will depend on track height and circuit layout.

These parameters will also depend on equipment manufacturer, please contact Electra Technical Support Department for specific recommendations.

Below are general recommendations and guidelines:

Wet-thickness: 60 to 100 µm (1.2 to 4 mils)

Tank pressure and coating speed are set to give desired wet thickness.
Atomising pressure should be set to give minimal mottling.
Shaping air is to be adjusted to give an even spray pattern.

Lower atomising pressures and higher coating speeds will lead to increased mottling.

Tack-dry:

The aim of the tack-drying stage is to solely remove the solvents. It is important for the drying chamber (static or conveyorised) to have good air circulation with air supply and extraction facilities.

Convection dry

Recommended drying settings and hold times will vary with hardener selection, see below.

<table>
<thead>
<tr>
<th>Hardener</th>
<th>Recommended/Max temperature</th>
<th>Recommended/Max time (mins)</th>
<th>Max hold-time after optimum tack-dry</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-4090</td>
<td>75/80 ºC (167/176ºF)</td>
<td>40/60</td>
<td>72 hours</td>
</tr>
</tbody>
</table>

IR Drying

IR drying is dependent on coating application method, IR wave-length and IR intensity.

Please contact Electra Technical Support Department for recommendations regarding specific equipment types and manufacturers.
**Exposure**

Step wedge: 10-12 clear (Stouffer 21 step).
Note: exact milliJoule requirements will vary with formulation type.

Determination of the correct exposure should be carried out after setting the developing speed since this will affect the step wedge reading obtained.

Step wedge checks should be carried out on brushed copper with the step wedge under the phototool. Energy level should be measured through the artwork and mylar/glass. It is important to recognise that the energy level should only be used as a guide for setting the correct exposure; step wedges should be used for determining the actual exposure setting.
Separate exposure tests should be carried out for each different colour, as variations in lamp emissions can cause differences in exposure speed. After determining the correct setting, energy level can be monitored as a means to check for any changes in lamp output.

**Developing**

Developer: 1% soln sodium or potassium carbonate.
Spray pressure: 1.5 - 2.5 kgcm$^{-2}$, 20 - 40 psi, 1.4 - 2.8 Bar
Spray time: 30-90s in carbonate chamber(s) (dependent on quantity of ink in holes).
Temperature: 35 to 40°C (95-104°F)

Boards should be well rinsed with fresh water and fully dried after developing.
Do not final cure boards when wet.

The optimum developing speed is set when an unexposed board develops off completely, 25-50% of the way through the machine. This speed should be ascertained by preliminary tests prior to making exposure tests.

**Developing speed and break-point settings will be determined by the amount of ink deposited in the holes during coating.**

Due to the varying degree of ink deposited in holes, different application methods will require different developing speeds.

Typical developing speeds using a 2m long carbonate chamber:

- Screen-print
  1.3 to 2.0 mmin$^{-1}$
- Air-spray
  3.0 to 4.0 mmin$^{-1}$

**Final Cure**

Convection oven: 60 mins at 150°C (300°F)  Time at board temperature
UV bumping

It is not normally necessary to UV cure Carapace®EMP110 HD but under certain conditions it may be advantageous (see below). Under these conditions, conveyor speeds should be set to attain 1500 to 2000 mJcm⁻².

High film weight plating:

When depositing high filmweights and/or coating heavily plated tracks it is sometimes possible to see slight wrinkling of the soldermask between the tracks after final cure. UV curing before final cure may prevent this.

Flux residues/staining:

Occasionally flux residues or staining can be seen on boards, particularly after Hot Air Solder Levelling with very acidic or aggressive fluxes. Washing boards when still hot causes this and can be exaggerated by using hot water rinse. Boards must be allowed to cool after soldering before rinsing and it is recommended all rinse solutions be below 40°C (104°F).

If staining does occur it can be removed by post baking boards, after soldering, for 10-15 mins @ 120-150°C (248-300°F). Alternatively if it is not possible to cool boards after HASL, staining can be prevented by giving boards a UV bump cure after the final thermal cure.

Reduced ionic contamination:

Certain fluxes, in conjunction with a poor recirculated-rinse after HASL, can lead to increased levels of ionic contamination. Although Carapace® EMP110 HD has proven to give very low contamination figures, in these extreme cases a UV bump after final cure will reduce the risk of increased levels.

Reduced soldermask outgassing:

Where important soldermask outgassing can be reduced by a post-cure UV bump (see page 9).

Via hole plugging

Carapace® EMP110 HD can be used for reliable via-hole plugging during the initial soldermask print stage. In order to achieve 100% of holes plugged it is advisable to use a double print stroke.

In order to avoid splitting or blistering of the vias please note the following:

Tack-dry: Minimum of 40 mins at 80°C (176°F)
Exposure: Minimum clear 12 using Stouffer 21-step wedge
Developing: Minimum speed to ensure required holes wash clean

If the board design requires prolonged developing times due to small hole development it is recommended boards are given a pre-bake after developing before final cure to allow slow release of any trapped moisture from vias.

Although it is not recommended to UV bump before final cure, it is advisable to pre-bake boards prior to passing through the UV curer if utilising a UV bump at this stage.

Pre-bake: 15 to 30 mins at 70 to 80°C (158-176°F)
**Safelight**

It is not normally necessary to print Carapace®EMP110 HD under safelight conditions, although it may be advisable if there are long delays before drying. Between drying/exposing and exposing/developing, boards should be kept in yellow light. Boards should, in any case, be kept out of direct sunlight until completely processed.

**Notation/marking inks**

Both UV and thermal curing notation inks are suitable for use with Carapace® EMP110 HD. Thermal curing inks may be applied before or after final cure. If UV curing notation inks are used they should be applied before final cure and before UV bump if this is used. In this case UV curing the notation ink will serve as the bump for the soldermask.

**Stripping**

After developing, any reject boards may be stripped of soldermask using a 5% NaOH solution at 40-50°C (104-122°F).

After curing, soldermask can be stripped using a proprietary soldermask stripper such as ES108H/4000.

**Cleaning**

Equipment should be cleaned of residual soldermask using SW200 or Dowanol PMA.

**Shelf-life**

Store at 10 - 25°C (50 - 77°F), away from sources of heat and direct sunlight.

EMP110 HD pastes have a minimum 12 months from date of manufacture.

All H-4090 products have a minimum of 24 months from date of manufacture.
